

Obsidian knowledge, ready for AI.

Share selected local materials with context, then keep useful results in the same Obsidian workspace.

A focused workflow, not another knowledge base

agentNote keeps ownership in your vault. It turns a file, folder, note, or selection into a local link that an agent can read, and gives the agent a clear path to write results back.

01

Choose a source

Use a local file, folder, Obsidian note, or selected passage.

02

Share a local link

agentNote starts a local-only service and creates a scoped address.

03

Hand it to an agent

Connect Claude Code, Codex, WorkBuddy, or another compatible agent.

04

Keep the result

Ask the agent to write conclusions, drafts, or updates back to Obsidian.

Local by design

The service listens on your computer. Sharing is deliberate, scoped, and stays inside your local workflow.

GET STARTED

From one note to a reusable workflow.

The first successful handoff takes only a few steps. Use the built-in guide whenever you need a reminder.

Your first handoff

1 Open agentNote

Enable the plugin and confirm that the local service is running.

2 Connect an agent

Select an available integration. If it is not installed, open its official website from the card.

3 Share from Obsidian

Right-click a file, folder, note, or selection, then choose the agentNote share action.

4 Send the local link

Paste the generated link into your agent conversation and ask it to read, use, or update the material.

Review your activity and reusable knowledge in the agentNote profile.
